

# After-sales defect rate of energy storage lithium batteries

## Overview

The best conditions for long life spans of lithium ion batteries are using LFP chemistry, charging within a limited range, at low charge-discharge rates (C-rates) at a stable temperature of around 25C. This might be associated with a decline rate for batteries of around 2% per 1,000. The global installed capacity of utility-scale battery energy storage systems (BESS) has dramatically increased over the last five years. Other Storage Failure. defects accounted for nearly 50% of our QA findings. The BESS integration process is highly manual and labor-intensive, with less stringent quality control procedures. upstream components that were not caught during earlier quality checks. Government nor any agency thereof, nor any of their employees, makes any warranty, expressed or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness, of any information, apparatus, product, or. Battery cells can fail in several ways resulting from abusive operation, physical damage, or cell design, material, or manufacturing defects to name a few.
