

Battery circuit board explanation

Overview

A BMS is essential for extending the service life of a battery and also for keeping the battery pack safe from any potential hazard. The protection features available in the 4s 40A Battery Management System are: 1. Cell Balancing 2. Overvoltage protection 3. Short circuit protection 4. Undervoltage protection The schematic of this BMS is designed using KiCAD. The complete explanation of the schematic is done later in the article. The BMS module has a neat layout with markings for connecting the BMS with different points in the battery pack. The image below shows how we need to connect the cell with BMS. The BMS acts like 4 separate modules. The above image shows the complete circuit diagram of the BMS circuit, as discussed above the circuit can be divided into smaller modules for. The BMS has 2 ICs, DW01, and BB3A; some variants of this BMS may have the same ICs or similar ICs from different manufacturers. But all the ICs will have the same pinouts and functioning. I will be discussing the 2 ICs later.

A Battery Management Unit (BMU) is a critical component of a BMS circuit responsible for monitoring and managing individual cell voltages and states of charge within ...

What is a lithium battery BMS protection board?

The battery protection board BMS is a circuit board that protects the battery. It is mainly composed of electronic circuits. It accurately monitors the voltage of the cell and the current of the charging and discharging circuit under the environment of -40°C to $+85^{\circ}\text{C}$, and controls the on and off of the current circuit in time.
