

# Battery pack supplementary capacity test

## Overview

Fast and accurate screening of retired lithium-ion batteries is critical to an efficient and reliable second use with improved performance consistency, contributing to the sustainability of renewable energy systems. ••Propose a fast and accurate screening approach with pack-level testing. Lithium-ion batteries (LIBs), the main pillar of energy storage technology for electric vehicles (EVs), suffer from performance degradation during usage and storage in terms of capacity. 2.1. Dynamic characteristic-based screening principleAs mentioned previously, screening based on static-characteristic criteria may be incomprehensive. 3.1. Configuration of the retired battery packThe LIB pack retired from an electric vehicle with a mileage of 32,500 km that had been operating in a southern Chinese city for over three years. 4.1. Comparison of the screening resultsThe screening process is based on pack-level testing and the performance consistency of the screened modules is evaluated and validated.
