

# Do private network base stations use energy for communication

## Overview

Many remote areas lack access to traditional power grids, yet base stations require 24/7 uninterrupted power supply to maintain stable communication services. The large-scale deployment of electric power wireless private networks (EPWPNs) has significantly increased the number of base stations in substations, transmission corridors, and distribution terminals, leading to rapidly rising electricity expenditure for continuous wireless coverage and. As 5G continues to evolve, new features and solutions to further improve energy performance are added to the standards. It acts as a bridge, connecting your phone to a vast communication network to ensure smooth information flow. The Small Cell Forum predicts the installed base of small cells to reach 70. "A 5G base station is generally expected to consume roughly three times as much power as a 4G base station.
