## Overview

Concentrated solar power facilities are a kind of thermal power plant to generate electricity. Then concentrated solar powersystems use solar thermal collectors to obtain heat. These plants use fuel to generate steam at a very high temperature. The generated steam drives a steam turbine that is connected to an. Heating water to levels below boiling allows the use of black collectors for thermal absorption of solar radiation. Heating a swimming pool. Solar Underfloor Heating is a kind of solar heating. It consists of an electrical resistanceglued to a mesh placed under the tiles or other pavement types on the floor. Solar thermal systems can provide power underfloor heating. Getting cold from heat is a paradox, but it is possible thanks to the absorption cooling technique. The technology used in these systems, absorption. Domestic hot water (DHW) is the water that we use at home. For this proposal, we do not need this water to be excessively hot. Thus, we can use flat.
