

Flywheel energy storage motor control system

Overview

Flywheel energy storage motor systems are revolutionizing how industries store and manage power. Unlike traditional batteries, these systems use rotational kinetic energy to deliver rapid-response electricity, making them ideal for applications requiring short-duration, high-power. Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm. Electrical energy is thus converted to kinetic energy for storage. The core technology is the rotor material, support bearing, and electromechanical control system. Compared with other energy storage systems, FESSs offer numerous advantages, including a long lifespan, exceptional efficiency, high power. The concept of using linear induction motors to lift, constrain, accelerate, and decelerate a large-scale flywheel is proposed, and some of the advantages are investigated.
