

# How many generators are there in the wind turbine cabin

## Overview

The nacelle 3 forms the upper part of the wind turbine and houses the key components used to convert mechanical energy to electrical energy. They include the drive shaft 4, gearbox 5, generator, transformer 7, braking system 6. The nacelle (2) for the wind turbine (1) includes the generator (3), load-bearing structure (4), support structure (5), electrical system (7), yaw system (6), control system (8) and Shell (9). The generator (3) comprises a rotating part and a stationary part, which is connectable to a load-bearing. Peek under the nacelle and you'll find everything from gearboxes and generators to brakes, shafts and yaw systems. But what exactly do these mechanical feats of engineering actually do to help a turbine produce wind energy?

And how do wind turbines work?

Here, I answer both of those questions and. How many generators are there in the win operation produces just over eight megawatts of power. The biggest offshore wind farm in the world, Hornsea One, located in the North Sea off the Yorkshire coast, consists of 174 wind turbines of seven megawatts. Overall the wind farm generate 1. This phase is equipped with Goldwind Science & Technology GW 184/6450 turbines. Each turbine has a nameplate capacity of 6.
