

# How to connect the cable at the end of the photovoltaic panel

## Overview

Prepare Cables: Crimp MC4 connectors to solar cables. Connect Panels: Follow series or parallel wiring method. Connect to Inverter: Match voltage range. Cut cables cannot be returned, so we want to be sure you fully understand how to choose the appropriate length and how to use them to connect your panels together. An MC4 extension cable is very similar in concept to an electrical extension cord. Just like an extension cord has a male plug on one. This configuration refers to the connection when the positive terminal of one panel is linked to the negative terminal of the next solar panel. While wiring solar panels in series, the current remains the same, whereas the voltage adds up (increases). Their main task is ensuring power continuity and electricity flow throughout the whole solar. To have a functional solar PV system, you need to wire the panels together to create an electrical circuit through which current will flow, and you also need to wire the panels to the inverter that will convert the DC power produced by the panels to AC power that can be used in your home and sent. Solar wires need connectors to connect them in the right place.
