

# Is there a big difference in the angle of photovoltaic panels between winter and summer

## Overview

Most homeowners can expect +/- 15 degrees in the summer and winter. With this in mind, the best method for achieving maximal efficiency year-round is to align your tilt angle with the sun's equatorial position. Any orientation more or less will result in an imbalanced loss of. This fact causes the winters to be cold due to lower solar radiation and summers to be hot as the solar radiation increases. To make the best out of the available solar radiation, compensating the tilt angle of your panels according to the different positions of the sun will optimize power output. The tilt angle directly influences how much solar radiation your photovoltaic panels capture throughout the year. Panels positioned perpendicular to the sun's rays absorb maximum energy, but the sun's position changes with seasons and your geographic location. This article explains tilt fundamentals, offers latitude-based recommendations, and covers seasonal adjustment, roof constraints, and installation tips to help.
