

Lead-acid batteries and supercapacitors

Overview

Independent renewable energy systems such as wind and solar are limited by high life cycle costs. The main reason is the irregular charging mode, which leads to the battery life cycle not reaching the expected use [1-3]. According to the research, the battery has an optimal power density range; if this value is exceeded, the. This study demonstrated the development and prospect of hybrid super-capacitor and lead-acid battery power storage system. The performance of super-capacitor was studied to verify the performance of super. The result are as follows: 1. The charging efficiency is higher when the super-capacitor is charged preferentially. 2. Sequential charging is adopted, with stable current, small fluctuation and better battery protection. We wish to confirm that there are no known conflicts of interest associated with this publication and there has been no significant financial support for this work that could have influenced its outcome.
