

Solar panels connected to voltage regulator tube

Overview

We all know pretty well about solar panels and their functions. The basic functions of these amazing devices is to convert solar energy or sun light into electricity. Basically a solar panel is made up with discrete sections of individual photo voltaic cells. Each of these cells are able to generate a tiny magnitude of electrical power. The voltage acquired from a solar panel is never stable and varies drastically according to the position of the sun and intensity of the sun rays. Referring to the proposed solar panel voltage regulator circuit we see a design that utilizes very ordinary components and yet fulfills the needs just as required by our specs. A single IC LM. The following figure shows a high current voltage regulator circuit using the LM338 ICs. The high current is achieved by connecting many number of LM338 ICs in parallel over a single. The charging current may be selected by appropriately selecting the value of the resistors R3. It can be done by solving the formula: $0.6/R3 = 1/10$ battery AH The preset VR1 is adjusted for.
