

Thin-film solar panel installation requirements and standards

Overview

Thin-film solar panels are exactly what they sound like — much thinner versions of the solar panels you're familiar with. What makes them different is not only how thin they are, it's how their size allows them. You'll pay around £1.04 per watt for thin-film solar panels, or roughly £6,240 for a 6 kW system. That's cheaper than the cost of a 4 kW solar panel system, which will typically set you. Your home is probably suitable for thin-film solar panels, but their lower efficiency means a lot of properties won't be able to generate enough electricity to replace or significantly reduce. Solar panels can also increase the value of your property since more and more people want homes with solar panels. Our National Home Energy Survey found that 69% of Brits would buy a house with solar panels. You can install thin-film solar panels in much the same way as an ordinary solar array. The major difference is you can install them on more surfaces, such as on caravans and boats.
