

What are the difficulties in photovoltaic bracket design

Overview

The bracket needs to bear the weight of the solar panel and ensure its stability. When designing flexible photovoltaic supports, the requirements of structural stability, weather resistance, lightweight and strength must be comprehensively considered to ensure the long-term reliability of the supports in different climate conditions. Therefore, studying the strength of solar. However, in the EPC mode, there are common construction problems in the installation of photovoltaic brackets, such as insufficient foundation construction, poor component connection, and inadequate anti-corrosion treatment, which will directly have a negative impact on the life cycle of the entire. Photovoltaic (PV) systems (or PV systems) convert sunlight into electricity using semiconductor materials. A photovoltaic system does not need bright sunlight in order to operate. It can also generate electricity on cloudy and rainy days from reflected sunlight. PV systems can be designed as.
