

What is a photovoltaic support array

Overview

A PV array, also known as a Photovoltaic array, is a collection of multiple Solar Panels. Unlike individual solar panels that generate limited power, PV arrays combine multiple panels to create systems capable of powering. Solar photovoltaic modules are where the electricity gets generated, but are only one of the many parts in a complete photovoltaic (PV) system. In order for the generated electricity to be useful in a home or business, a number of other technologies must be in place. Each Solar Panel is composed of numerous PV cells, which are made up of two layers of silicon that have been specifically treated to allow electricity to flow through them in a particular manner. Photovoltaic modules consist of PV cell circuits sealed in an environmentally protective laminate, and are the fundamental building blocks of PV systems. The solar array is the most important part of a solar panel system - it holds all the panels in your system, collects sunlight, and converts it into electricity.
