

Wind turbine wind resistance report

Overview

The purpose of this paper is to systematically summarize and analyze the research results of the existing wind power tower structure in wind resistance, seismic resistance and vibration control, and put forward the direction and suggestions for further optimization. The purpose of this paper is to systematically summarize and analyze the research results of the existing wind power tower structure in wind resistance, seismic resistance and vibration control, and put forward the direction and suggestions for further optimization. As an important structure supporting the wind turbine, the wind power tower is faced with the complex environmental impact of wind load and seismic load during operation. This paper reviews the current research progress and methods on wind resistance, seismic resistance and vibration control of. As part of the 2024 Collegiate Wind Competition (CWC) sponsored by the Department of Energy and the National Renewable Energy Laboratory, this year's CU Boulder Wind Team has designed a small-scale prototype offshore wind turbine capable of withstanding wind speeds up to 22 m/s. The turbine will. This paper describes the analysis of a wind turbine and support structure subject to simulated hurricane wind fields.
